

Security Training for Government Agencies

What is the cost of compromised network security? While the answer for a commercial business might be in dollars, how do you put a price tag on the American way of life? TechGuard's experience working with government agencies has facilitated the development of curriculum for all levels of government personnel. The goal is to address the vulnerabilities of the United States Government Critical Infrastructure.

Courses are designed from the bottom up to provide the appropriate level of training to all government employees from users through executives. Content is based on existing and forthcoming government regulations as well as general security best practices. The tiered curriculum is designed to provide security awareness to the users, security training to ISSO's, managers and executives, and security education to security technicians.
